

ABSTRACT

A protective garment is provided consisting of a garment body having at least one sleeve, a glove associated with the sleeve, and an adhesive disposed upon a surface of the glove, the sleeve, or both. The adhesive forms an interface between the two surfaces. The adhesive has sufficient adhesion to remain affixed substantially to the surface to which it is applied while having sufficient strength to enable donning of the garment without damaging the interface. The glove is removable from the garment body by breaking the interface, without causing damage to the surfaces of the glove or garment body, and without migration of the adhesive from the surface to which it was applied.
